

● **DESCRIPTION:**

The holding electromagnets (electromagnetic and electropermanent) are used to attract and hold ferromagnetic pieces.  
 The maximum force efficiency is achieved with the piece to be hold over the attraction's face and in direct contact with both poles (outside pole and inside pole).

It is not recommended to use holding electromagnets in applications that require an air gap > 0.2mm. The retention force will fall down exponentially when the air gap increases (as can be seen in the data sheet of each product).

● **CONDITIONS FOR A CORRECT INSTALATION, USE AND MAINTENANCE:**

In electropermanent holding electromagnets, vibration and temperature higher than the one recommended must be avoided because it could damage the magnet and the product would loose force.

● **MAINTENANCE:**

If the attraction face suffers bumps when working, a reduction of force will occur due to the air gap generated by them, and to recover the initial force, attraction face must be rectified.

## ● CUSTOMIZATION

The models described in the catalogue are standard and minimum manufacturing batches are not required. However, there is the possibility of customizing them to suit better customer's needs. See below some of the most common customizations.

If any modification is needed, please ask NAFSA about the possibility and the minimum manufacturing batch required.

### 1. ELECTRICAL CUSTOMIZATION

#### a) Integrated electronics only in versions with DIN43650A connector:

##### a.1) For peak suppression Examples:

Free wheel diode+second diode to protect the free wheel diode against reverse polarity.

##### a.2) Power display Examples:

Connector under voltage display by LED

##### a.3) For rectification Examples:

4 diodes with varistor at the input

4 diodes with double varistor.

#### b) Cable length modification and terminal or connector mounted over cables:

In some holding electromagnet models, cables can be replaced by connector DIN43650 or clamping screw (see each serie datasheet). In the holding electromagnet models which have supply cables, this length can be modified to customer requirement. Likewise any kind of terminals or connectors can be added to the cables.

#### c) Intermediate duty-cycle manufacturing:

In the VEM and ERM are manufactured by default with duty-cycle is 100%, but NAFSA can manufacture any intermediate duty-cycle from 0 to 100, but the viability depends on the model and the voltage associated with it. For any special requirement, please ask NAFSA.

In the VM and VM/ND series the duty-cycle can not be modified.

### 2. INSULATION CLASS CUSTOMIZATION:

In the VEM serie, insulation class can be increased until H (180°C).

In the VM and VM/ND, insulation class can be increased until F (155°C).

### 3. PROTECCIÓN RATE CUSTOMIZATION IP (EN60529):

Standard models are IP65, but it can be decreased until IP40 to cheapen production cost.

NOTE: All this customizations cannot be applied to all models, ask NAFSA for each case.

## • CUSTOMIZATION

The models described in the catalogue are standard and minimum manufacturing batches are not required. However, there is the possibility of customizing them to suit better customer's needs. See below some of the most common customizations.

If any modification is needed, please ask NAFSA about the possibility and the minimum manufacturing batch required.

### 4. MECHANICAL CUSTOMIZATION:

The viability of the modifications depends on the model. For any special requirement, ask NAFSA.

#### 4.1) Fastening holes modification:

#### 4.2) Non-rotating holes integration:

#### 4.3) Cable or connector position modification:

#### 4.4) Carcase shape modification:

#### 4.5) Antiremanence pins:

#### 4.6) Holding plate fabrication:

#### 4.7) Position detection system:

NOTE: All this customizations cannot be applied to all models, ask NAFSA for each case.

# • VEM SERIE

The attraction and holding of the magnetic pieces are obtained feeding the winding inside the solenoid. When the power supply stops the electromagnet loses the piece.  
When working with loads security norms must be respected.

Protection rate: **IP65**  
Insulation class: **B (130°C)**

e (mm): Thickness of the piece to hold

The table 2 gives for each type of holding magnet, the values of the force of maintenance (Fm) based on the air gap, measured in the following conditions:

- Direct current supply.
- Flat piece (3µm rugosity) in A°St37, thickness as shown in the table 2 and dimensions are similar or bigger than the attraction face.
- Room temperature 35°C.
- Coil working on its regime temperature.

At different conditions, the magnetic force (Fm) may decrease. The value of the magnetic remanence after the power supply stops is 5% of the holding force.

- \*Earthing is recommended if the metallic parts are accessible.
- \*Technical explanation: see pages 4 & 5.
- \*Under demand: any size, voltage, duty cycle etc can be manufactured.

**When lifting or handling heavy loads a minimum security margin of 3 must be respected, the weight of the load cannot exceed 33% of the magnetic force.**

# ERM SERIE

The attraction and holding of the magnetic pieces are obtained by feeding the winding inside the solenoid. When the power supply stops, the solenoid loses the piece.

When working with loads, security norms must be respected.

e (mm): Thickness of the piece to hold

The table 2 gives for each type of holding magnet, the values of the minimum pulse time and resting time measured in the following conditions:  
 - With a weight of 5% of the maximum magnetic force made by each model  
 -Coil working on its regime temperature.  
 The table 2 gives for each type of holding magnet, the values of the force of maintenance (Fm) based on the air gap, measured in the following conditions:  
 -Holding magnet without voltage.  
 -Flat piece (3µm rugosity) in A°St37, thickness as shown in the table 2 and dimensions are similar or bigger than the attraction face.  
 -Room temperature 35°C.  
 -Coil working on its regime temperature.  
 At different conditions, the magnetic force(Fm) may decrease.  
 The value of the magnetic remanence after the power supply stops is 5% of the holding force.  
 .Earthing is recommended if the metallic parts are accessible.  
 .Technical explanation: see pages 4 & 5.  
 .Under demand: any size, voltage, duty cycle etc can be manufactured.

**Under demand an internal protection** can be added to the coil to protect it of the overheating, generated by the no respecting of the times given by the duty cycles, this overheating can demagnetize the internal magnet or destroy the coil changing the proper working of holding magnet.

**⚠ When lifting or handling heavy loads a minimum security margin of 3 must be respected, the weight of the load cannot exceed 33% of the magnetic force.**

10	2800	2450	2150	1900	1600	1400	700	
18	3000	2550	2300	2000	1700	1500	800	

For these holding electromagnet correct working the minimum pulse and resting time must be respected:

- **Minimum pulse time: 300ms**
- **Minimum resting time: 5000ms**

The values of the minimum pulse time and resting time measured in the following conditions:

- Coil working on its regime temperature.
- Piece weight: 2 Kg (it is not recommended to use these holding electromagnet for lower weights)

The table 2 gives for each type of holding magnet, the values of the force of maintenance (Fm) based on the air gap, measured in the following conditions:

- Holding electromagnet without voltage.
- Flat piece ( $3\mu\text{m}$  rugosity) in A°St37, thickness as shown in the table 2 and dimensions are similar or bigger than the attraction face.
- Room temperature 35°C.
- Coil working on its regime temperature.

At different conditions, the magnetic force(Fm) may decrease. The value of the magnetic remanence after the power supply stops is 5% of the holding force.

**When lifting or handling heavy loads a minimum security margin of 3 must be respected, the weight of the load cannot exceed 33% of the magnetic force.**

## ● BP 1000-10 TYPE

It is a bipolar holding electromagnet with 1000mm of effective surface. The face is made with an angle to work with different pieces between  $\varnothing 120\text{mm}$  y  $\varnothing 250\text{mm}$ .

The attraction and holding of the magnetic pieces is obtained by feeding the coil inside the electromagnet. When the power supply stops the electromagnet looses the piece. When working with loads security norms must be respected.

Protection rate: **IP65**  
 Insulation class: **B (130°C)**  
 Standard voltage: **24Vdc**  
 Standard duty cycle ED: **100%**  
 Abs. power at 20°C: **217W**  
 Temperature rise "DV31" **40°C**  
 Solenoid weight: **47Kg**

### ● Maximum keeping force

$\varnothing$ Round bar (mm)	Force N/mm	Force N (for bar => 1000mm)
$\varnothing 120\text{-}\varnothing 200$	5.4	5400
$\varnothing 250$	8	8000

The forces values are obtained with the electromagnet at its working temperature and with the piece to be held in contact with whole attraction surface

1) To feed in alternating current the electromagnet will have an external rectifier.

2) It can be manufactured at any voltage, duty cycle, connection etc. Also other sizes for different applications.

3) Ground connection is recommended if to the metallic parts are accessible.

### ● General dimensions

When lifting or handling heavy loads a minimum security margin of 3 must be respected, the weight of the load cannot exceed 33% of the magnetic force.
